**Abstract:** We assume that knowledge arises through an interpretation of phenomena and ask what type of process is involved. To this end, on the basis of a theory of cognition and a Peircean theory of signs, we introduce a process model of interpretation and show the existence of a relation of our model with Platonic solids and the golden section. The model's relation with syllogistic, hence the possibility of a relation between phenomena and reasoning, implies that knowledge can be inevitable.
